

## Minimum uncertainties at Radiation Metrology Laboratory, STUK

Black uncertainties/radiation qualities are part of STUK's CMCs according to CIPM MRA

Blue uncertainties/radiation qualities do not belong into STUK's CMCs according to CIPM MRA:

Uncertainties are expressed as relative expanded uncertainties ( $k=2$ , 95% confidence level).

Uncertainties are estimated individually for each case, the table presents the minimum uncertainties for services.

| Quantity/calibration                 | Air kerma | H*(10) | Hp(10) | Hp(0.7) | Hp(3) | Absorbed dose | Fluence | Surface emission rate | KAP | KLP | Reference air kerma rate | Irradiation in terms of air kerma | Traceability |
|--------------------------------------|-----------|--------|--------|---------|-------|---------------|---------|-----------------------|-----|-----|--------------------------|-----------------------------------|--------------|
| Radiation quality                    |           |        |        |         |       |               |         |                       |     |     |                          |                                   |              |
| $^{60}\text{Co}$                     | 3.0       | 5.0    | 5.0    | 5.0     | 5.0   | 3.0           |         |                       |     |     | 3.0                      | PTB                               |              |
| $^{60}\text{Co}$                     | 0.47      |        |        |         |       | 0.51          |         |                       |     |     |                          | BIPM                              |              |
